

Stainless steel bellows units EKO, stainless steel flexible tubes ES

TECHNICAL INFORMATION

- EKO: fault-free machine operation due to absorption of thermal and pressure expansions
- EKO: high bursting resistance due to multiple-layer bellows
- EKO: axial and lateral movement absorption
- ES: protection from material fatigue thanks to vibration absorption
- ES: angular and lateral movement absorption
- ES: compensation for installation tolerances due to optional lengths

1 Application

1.1 EKO

EKO..R-I with internal threads

EKO..R-A with external threads

EKO..F with flanged connection

The stainless steel bellows unit EKO is designed for stress-free and safe pipe installation and to prevent transmission of vibration in gas, air and water installations.

The stainless steel bellows unit EKO can compensate for thermal and pressure expansions in pipelines, disengage elastically-mounted units from the systems to which they are connected and compensate elastically for relative movements between system parts, see page 22 (Relative movement). This results in reduced forces and moments at the connections.

The stainless steel bellows unit with hot-galvanized flange permits the use of landfill gas.

Stainless steel bellows units EKO can optionally be supplied with an integrated restricting orifice for adjusting the gas and air flow rate for gas burners.

The stainless steel bellows unit EKO..R can be used in operating temperatures of up to 250°C. EKO..F and EKO..FZ can withstand high temperatures (HTR) in conjunction with WL-HT flange seals, see page 13 (Flange seal WL-HT).

Stainless steel bellows units at the kiln in a brickworks

1.2 ES

ES..RA with external thread

ES..F with flanged connection

The stainless steel flexible tube ES is used for stress-free, flexible connection of devices and pipes and to prevent transmission of vibration in gas, air and water installations.

The stainless steel flexible tube ES can absorb vibrations with a high frequency and low amplitude, e.g. in fuel pipes, reduce structure-borne noise in pipelines for example, compensate for inaccuracies in installation between units and serve as a flexible pipe element on presses for example. It can be fitted in places where no fixed points can be located.

The stainless steel flexible tube ES is optionally available in any length.

Stainless steel flexible tubes in the supply lines of buildings

Stainless steel flexible tubes on gas engine supply lines

1.3 Application examples

1.3.1 Gas and air supply to a drying kiln

Pressure and temperature factors from the burner influence the gas and air supply. The stainless steel flexible tube and bellows unit compensate for the pressure and thermal expansion in the pipelines. They ensure that the process runs without any problem.

1.3.2 Exhaust gas system on a compressor

Two stainless steel flexible tubes mounted at right angles in the exhaust gas pipe reduce vibrations on all sides which the unit causes on the connected pipe.

1.3.3 Fuel pipes on a gas engine

When a gas engine is connected to the fuel pipes, installation tolerances can occur at the connection points. The simple way to compensate for these is with stainless steel flexible tubes.

1.3.4 Gas pressure control, measuring and safety train

The stainless steel flexible tube offers an effective and cost-efficient solution for protecting gas lines, on thermal flue air purification systems for instance, against thermal expansion. It reduces the structure-borne noise in the pipeline.

1.3.5 Gas and air supply to an aluminium smelting furnace

Pressure and temperature factors influence the gas and air supply. The stainless steel bellows units compensate for the

Application

pressure and thermal expansion in the pipelines. Stainless steel bellows units EKO..10P are specially designed to suit the Kromschroder ZIO burner for a high burner capacity at low operating pressure.

1.3.6 Pipes on a heating and solar system

The pipes between the collector, boiler and storage tank are adapted to the building architecture. Stainless steel flexible tubes are used to compensate favourably for inaccuracies in installation.

2 Certification

Certificates for EKO – see www.docuthek.com

Certificates for ES – see www.docuthek.com

EU certified

- DIN-DVGW tested and registered.

Type	DVGW test mark	Basis for test-ing
EKO..RI, EKO..RA	NG-4504AS3148	DIN 30681
EKO..F100P, EKO..F-Z	NG-4504AR3924	DIN 30681
ES	NG-4601AR0759	DIN 3384

- For all gases to DVGW Code of Practice G 260, air and water.

Eurasian Customs Union

The products EKO, ES meet the technical specifications of the Eurasian Customs Union.

3 Selection

3.1 ProFi

A web app selecting the correct product is available at www.adlatus.org.

3.2 Stainless steel bellows units EKO

3.2.1 Selection table

Option	EKO 15–20	EKO 25–50	EKO 65– 150	EKO 200	EKO 250– 350

500-1000	Length [mm]

4 Project planning information

4.1 Installation

If the stainless steel bellows unit EKO or the stainless steel flexible tube ES are used with external aggressive media acting on them, we recommend using additional protection, e.g. a heat shrink tube.

4.1.1 EKO

Only install one bellows unit between two fixed points or guide bearings.

Distance between the bellows unit and fixed point **FP** or guide bearing **FL** $\leq 3 \text{ DN}$.

Provide fixed points at the ends of pipe sections, which can absorb the axial compression force, the adjustment force of the bellows unit and the friction force of the guide bearings.

Dynamic stress:

A = page 22 (Angular movement), **L** = page 22 (Lateral movement), see Movement absorption, page 16 (EKO..R dimensions) or page 16 (EKO..R dimensions).

Vibration absorption: install the bellows unit as close to the vibrating unit as possible to avoid additional movements. Attach the pipeline immediately downstream of the bellows unit, independent of the vibrating unit, using a guide bearing **FL** or a fixed point **FP**.

If there are vibrations in all directions, install a second bellows unit at right angle to the first one.

Ensure a sufficiently good stand for the vibrating unit in order to absorb the axial compression force.

The maximum vibration amplitude (page 22 (Vibration amplitude)) may amount to ≤ 5 to 10% of the movement absorption. Movement absorption, see page 16 (EKO..R dimensions) or page 16 (EKO..R dimensions).

Determine the initial stress for the expansion or compression to be expected:

$$V = D \times \left(0.5 - \frac{t_E - t_{\min}}{t_{\max} - t_{\min}} \right)$$

V = Initial stress [mm]

D = Expansion of pipeline [mm]

t_E = Installation temperature [°C]

Project planning information

$t_{\min}$ = Min. operating temperature [°C]

$t_{\max}$ = Max. operating temperature [°C]

Positive initial stress = expand bellows unit,

negative initial stress = compress bellows unit.

Define the installation space on the basis of the overall length of the bellows unit:

$$L_E = B_L \pm V$$

L_E = Installation space

B_L = Overall length

V = Initial stress

If a restricting orifice is used, the overall length is increased by 3 mm, see page 13 (Restricting orifice).

EKO..F

High temperature resistant in conjunction with WL-HT flange seal only, see page 13 (Flange seal WL-HT).

4.1.2 ES

Avoid torsion load on the stainless steel flexible tube.

For expansion and vibration absorption, attach the pipeline directly downstream of the stainless steel flexible tube using a fixed point **FP**.

Note the minimum bending radius for one-off or frequent movement, see page 18 (ES dimensions).

Impermissible bending immediately downstream of the connection element can be avoided by using rigid pipe bends.

Always install the stainless steel flexible tube at right angles to the direction of movement.

Note distance to the wall or floor.

If there are vibrations in all directions, install a second stainless steel flexible tube at right angle to the first one.

4.2 Flow velocities

It is recommended that flow velocities of 6 m/s (1180 ft/min) are not exceeded in order to avoid flowing or whistling noises.

5 Accessories

5.1 Flange seal WL-HT

EKO..F and EKO..FZ can only withstand high temperatures (HTR) in conjunction with WL-HT flange seal for the inlet and outlet flange.

Flange seal	Order No.
WL-HT DN 25	03352221
WL-HT DN 32	03352222
WL-HT DN 40	03352223
WL-HT DN 50	03352224
WL-HT DN 65	03352225
WL-HT DN 80	03352226
WL-HT DN 100	03352227
WL-HT DN 125	03352228
WL-HT DN 150	03352229
WL-HT DN 200	03352230

5.2 Restricting orifice

Restricting orifices made of V2A steel can be supplied for stainless steel bellows units EKO if required. Please ask us for a quotation.

6 Technical data

6.1 EKO

Media: all gases to DVGW Code of Practice G 260, air and water or gases to DVGW Code of Practice G 262.

The pressure loss at the EKO is approximately twice as high as that of a smooth pipe of the same length.

Stainless steel bellows 1.4571.

EKO..R

Clamping rings made of stainless steel 1.4301, fittings made of galvanized malleable cast iron, REINZ-AFM 34 seal according to DIN 3535-6, flat-sealing, resistant to high temperatures (HTR).

Operating temperature:

air: -20 to +250°C,
gas: -20 to +250°C,
water: 0 to +100°C.

Short-term temperature peaks of up to 300°C are admissible.

Max. inlet pressure MOP:

air and water: 10 bar,
gas: 5 bar.

Observe the maximum allowable inlet pressure for dynamic stress and increased temperature, see page 20 (EKO, ES reduction factors).

EKO..F

Bellows made of stainless steel:

1.4571 up to DN 100, 1.4541 > DN 100.

Operating temperature:

air: -20 to +500°C,

gas: -20 to +150°C,
water: 0 to +100°C.

Max. inlet pressure MOP: 10 bar,
EKO 250F10P, EKO 350F10P: 1 bar.

Observe the maximum allowable inlet pressure for dynamic stress and increased temperature, see page 20 (EKO, ES reduction factors).

EKO..F: galvanized flange, EKO..FZ: hot-galvanized flange.
High temperature resistant in conjunction with WL-HT flange seal only, see page 13 (Flange seal WL-HT).

6.2 ES

Media: all gases to DVGW Code of Practice G 260, air and water or gases to DVGW Code of Practice G 262.

The pressure loss is approx. twice to three times as high as that of a smooth pipe of the same length. When installed in a 90° bend, it increases at maximum by a factor of 2.

Material: 1.4541 stainless steel corrugated tube, 1.4301 stainless steel sheathing.

ES..RA

DN 8 to DN 25 connecting threads on both sides, made of machining steel 1.0718, from DN 32 made of steel 1.0037.

Connection:

1 x external thread, conically sealing union,
1 x hexagon nipple and external thread to
EN 10226-1.

Welded stainless steel fittings.

Loose screw attachment parts made of galvanized malleable cast iron or cast steel.

Technical data

Operating temperature:

air, gas, water: -10 to +300°C;

the maximum allowable operating temperature may be reduced depending on the sealant selected.

Max. inlet pressure p_u :

air and water: 16 bar,

gas: 4 bar.

Observe the maximum allowable inlet pressure for dynamic stress and increased temperature, see page 20 (EKO, ES reduction factors).

ES..F

Welding flange made of stainless steel 1.4541,
(loose flange made of galvanized steel, PN 16 to
DIN EN 1092-1).

Operating temperature:

air, gas, water: -10 to +300°C.

Max. inlet pressure p_u :

air, gas and water: 16 bar.

Observe the maximum allowable inlet pressure for dynamic stress and increased temperature, see page 20 (EKO, ES reduction factors).

6.6 EKO, ES reduction factors

Pressure pulsation, pressure surges, pressure fluctuations, frequent movements, vibrations and high temperatures will reduce the max. allowable inlet pressure.

Calculating the maximum allowable inlet pressure:

$$p_{\text{max.}} = \text{MOP} \times k_d \times k_t$$

$p_{\text{max.}}$ = Permitted operating pressure [bar]
MOP = Maximum allowable operating pressure [bar]
 k_d = Dynamic reduction factor
 k_t = Temperature reduction factor

Dynamic reduction factor k_d

	Slight, slow movement; no vibration	Frequent, uniform movement; vibrations	Rhythmic, surge-type movement; strong vibrations
Stationary or slow and uniform flow	1	0.80	0.40
Pulsating and non-uniform flow	0.80	0.63	0.32
Rhythmic and surge-type flow	0.32	0.20	on request

Temperature reduction factor k_t

Temperature [°C]	EKO/ES from DN 125 material 1.4541	EKO up to DN 100 material 1.4571
20	1.00	1.00
50	0.93	0.92
100	0.83	0.80
150	0.78	0.76
200	0.74	0.72
250	0.70	0.68
300	0.66	0.64
350	0.64	0.62
400	0.62	0.60
450	0.60	0.59
500	0.59	0.58
550	0.58	0.58

7 Maintenance cycles

The products EKO, ES require little servicing.

8 Glossary

8.1 Axial movement

The movement of the stainless steel bellows unit or stainless steel flexible tube is absorbed in the axial direction.

8.2 Angular movement

The movement absorption of the stainless steel bellows unit or stainless steel flexible tube takes place at a certain angle.

8.3 Lateral movement

The movement of the stainless steel bellows unit or stainless steel flexible tube is absorbed laterally.

8.4 Relative movement

The relative movement is the movement of one body in relation to another.

8.5 Vibration amplitude

The vibration amplitude is the largest excursion of a vibration from the compressed to the extended bellows unit.
